Python For Beginners

Lab Exercise 13

In this lab, your task is to debug what is a basic shell of a program.

You will find within this folder three files:

- create_database.py,
- guestbook.py
- users.py

The create_database.py has no issues within it, just run the page to create the database. There are some bugs and problems within the other two pages, and your task is to discover them, debug what is causing them and fix them.

To open the guestbook file, all you need to run the guestbook.py -- users.py is included into that file. Running users.py will do absolutely nothing.

Like I said, this is just a shell of a program, and currently only supports logging in and registering. If you wish to, you can build on this shell and continue with your programming and keep learning based on what I provide within this lab.

Good luck, and thank you for learning Python with me.

-Alex
